General Notes

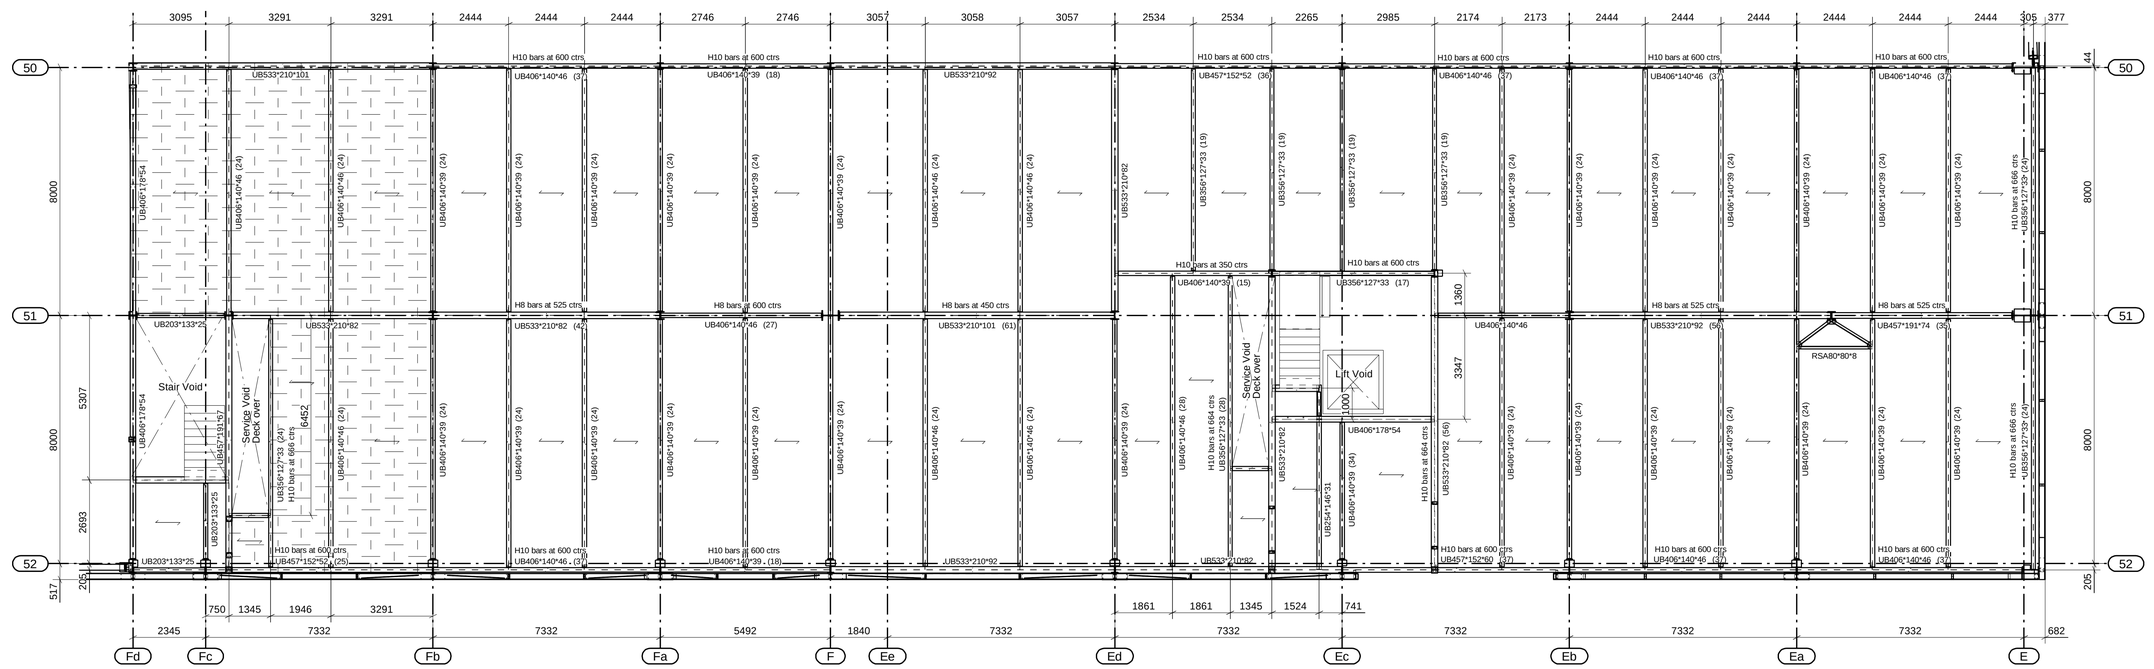
1. Do not scale from this drawing
2. Dimensions are in millimetres unless noted otherwise.
3. All levels are in metres unless noted otherwise
4. Erection mark for orientation denoted ▼
5. Only PDF issues of this drawing are controlled
6. All other formats of this drawing (e.g. DWG/AutoCad) are un-controlled and are used at your own risk.

Project Notes

1. Caunton Engineering is not the Principal or Lead Designer for this project.
2. The Lead Designer for this project has responsibility for approving this drawing.
3. The steel frame shown on this drawing has been designed to Eurocode 3.
4. The steel frame shown on this drawing will be erected in accordance with the tolerances specified in the current NSSS (National Structural Steelwork Specification)
5. Any queries relating to information on this drawing are to be referred, in the first instance to the Lead Designer.
6. This drawing is to be read in conjunction with all information produced by the Lead Designer, Architect, Engineer and all other specialist trade contractors employed on this project.
7. It should not be assumed the steel frame shown on this drawing has been coordinated with other specialist trade contractors regarding construction interfaces. Any queries should be raised with the Lead Designer.
8. It is the responsibility of all specialist trade contractors that depend upon the steel frame for support to ensure they understand the tolerances defined in the current NSSS. Other specialist trade contractors must make provision in the design and construction of their works, including checking dimensions and positions on site if necessary, to deal with any potential conflict of tolerances which may arise.

Decking Notes

1. Metal decking to be TR60x0.9mm. Grade S350 UNO
2. Decking to be double/single span U.N.O.
3. Concrete grade to be C30/37. 150mm thick.
4. Shear studs are 19mm diameter in accordance with EN ISO 13198
5. Fire resistance period 60 minutes to suit project
6. Min mesh A393 cover 25mm from top of slab. Please note the use of flying ends may be required to achieve the minimum concrete cover.
7. Caunton Engineering Limited (CEL) are responsible for the design of metal decking in temporary and permanent conditions. CEL will also advise the minimum concrete strength, depth and reinforcement required for our composite beam design and to achieve the minimum fire resistance period. CEL will also design the slab including reinforcement requirements under concentrated loads (where known), at openings and edge, and for anti-crack requirements. We will prepare all slab and reinforcement drawings and schedules. However, the responsibility for sitework and day joints are to be with others.
8. The supply, delivery and installation of reinforcement and casting of the slab is to be by others.
9. The design responsibility of the floor as a diaphragm is to be with CEL.
10. The design of the deck / steel frame does not include for flood pouring of concrete. Concrete is to be poured to a constant depth above beam top flanges to a tolerance of -0/+10mm. We recommend that the slab is cast in accordance with the guideline set out in the SCI publication P300 "Composite Slabs and beams using steel decking: Best practice for design and construction".
11. Depending on the quality of the slab pour we anticipate a flatness tolerance of SR3 in accordance with BS 8204. (Max 10mm gap below a 2m straight edge).
12. Number in brackets = min number of studs
13. Stud requirements on edge beams - See Drawing
14. If no studs noted provide 1 stud in alternative troughs or 600mm centres.
15. Any slab overhang past flange or support beam to be agreed with Caunton Engineering design department.
16. Composite edge beams to have shear studs located no closer than 6d (d = stud diameter) from the free edge of the slab.

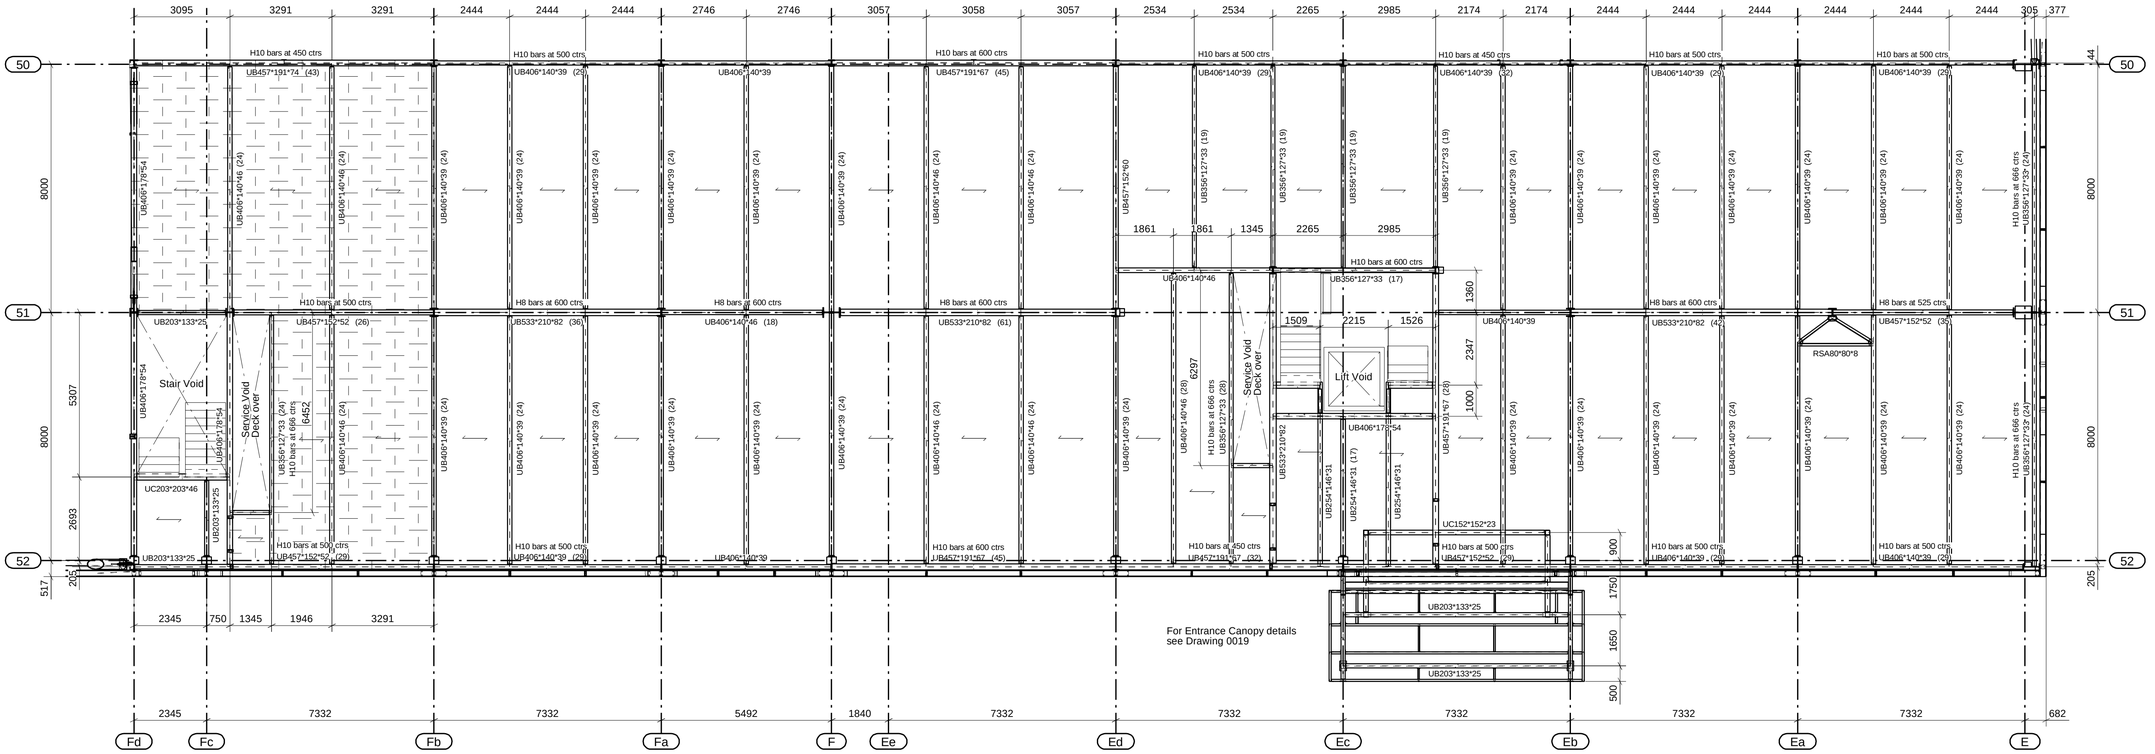


Denotes Decking Span

Denotes TR60 x 1.0mm Decking

Second Floor Plan

Top of Steelwork = 7.650m



For Entrance Canopy details see Drawing 0019

First Floor Plan

Top of Steelwork = 3.650m

General Notes

1. Do not scale from this drawing
2. Dimensions are in millimetres unless noted otherwise.
3. All levels are in metres unless noted otherwise
4. Erection mark for orientation denoted ▼
5. Only PDF issues of this drawing are controlled
6. All other formats of this drawing {e.g. DWG/AutoCad} are un-controlled and are used at your own risk.

Project Notes

1. Caunton Engineering is not the Principal or Lead Designer for this project.
2. The Lead Designer for this project has responsibility for approving this drawing.
3. The steel frame shown on this drawing has been designed to Eurocode 3.
4. The steel frame shown on this drawing will be erected in accordance with the tolerances specified in the current NSSS (National Structural Steelwork Specification)
5. Any queries relating to information on this drawing are to be referred, in the first instance to the Lead Designer.
6. This drawing is to be read in conjunction with all information produced by the Lead Designer, Architect, Engineer and all other specialist trade contractors employed on this project.
7. It should not be assumed the steel frame shown on this drawing has been coordinated with other specialist trade contractors regarding construction interfaces. Any queries should be raised with the Lead Designer.
8. It is the responsibility of all specialist trade contractors that depend upon the steel frame for support to ensure they understand the tolerances defined in the current NSSS. Other specialist trade contractors must make provision in the design and construction of their works, including checking dimensions and positions on site if necessary, to deal with any potential conflict of tolerances which may arise.

Foundation Notes

Setting out and Tolerances

1. All grid lines and datum levels are to be established and maintained throughout the steel frame erection period by the Principal Contractor.
2. Only Caunton Engineering drawings should be used to set out holding down bolts and washer plates.
3. The setting out tolerances for all holding down bolts and cast foundation levels is to be in accordance with Section 9.1 of the NSSS.
4. If post drilled resin or mechanical anchors are shown on the drawings they are to be installed strictly in accordance with the manufacturers' instructions.

Construction Sequence

5. All holding down bolts, resin/mechanical anchors and washer plates shown on Caunton Engineering drawings are supplied and delivered to site by Caunton Engineering.
6. If post drilled resin or mechanical anchors are shown on the drawings and are to be installed before steel erection starts they will be delivered to site with the holding down bolts.
7. Marking out and drilling of concrete for resin or mechanical anchors is to be by others.
8. Holding down bolts are strength grade 8.8
9. Conical bolt tubes must be placed around each H.D. bolt to form a pocket that will allow full rotational movement of the bolt at the top of the pocket. These are not supplied by Caunton Engineering.
10. All holding down bolts, washer flats and tubes should be placed in the required position before concrete is poured.
11. All threads to be thoroughly greased and protected before concrete is poured.
12. All foundations must have a smooth and level surface onto which steel packing plates can be placed when steel erection starts.
13. Every holding down bolt must be able to move in the pocket so they should be checked and if necessary shaken after concrete is poured and before it hardens.
14. Pockets must be kept clear of debris to ensure holding down bolts can move.
15. All timber templates used to cast the foundations are to be removed by the Principal Contractor or groundworks contractor prior to steel erection starting.
16. If polystyrene bolt tubes are used they must be removed by the Principal Contractor or groundworks contractor prior to steel erection starting.

Damage to Holding Down Bolts

17. If any holding down bolt is damaged after installation the Principal Contractor must report the matter to Caunton Engineering.
18. If a grade 8.8 holding down bolt is bent after installation no attempt should be made to straighten it as this may lead to the bolt fracturing.

Grouting of Bases

19. The organisation responsible for designing foundations is also responsible for specifying the product to be used to grout the holding down bolts and underside of column bases.
20. After the structure has been lined, levelled & plumbed by Caunton Engineering, to the tolerances stated in Section 9.6 of the NSSS, it will be handed over to the Principal Contractor for final checking and grouting.
21. All columns must be grouted within 24 hours of being handed over. Caunton Engineering is not responsible for grouting of columns.

Design Responsibility

22. Caunton are not responsible for the design of the foundation. We have designed the base plate and holding down bolts assuming adequate depth to accommodate the specified bolt embedment and also assume that edge distance does not dictate. The foundation designer is to confirm that the foundation can accommodate the loads, including the design of any additional reinforcement that may be required.

General Notes

1. Do not scale from this drawing
2. Dimensions are in millimetres unless noted otherwise.
3. All levels are in metres unless noted otherwise
4. Erection mark for orientation denoted ▼
5. Only PDF issues of this drawing are controlled
6. All other formats of this drawing (e.g. DWG/AutoCad) are un-controlled and are used at your own risk.

Project Notes

1. Caunton Engineering is not the Principal or Lead Designer for this project.
2. The Lead Designer for this project has responsibility for approving this drawing.
3. The steel frame shown on this drawing has been designed to Eurocode 3.
4. The steel frame shown on this drawing will be erected in accordance with the tolerances specified in the current NSSS (National Structural Steelwork Specification)
5. Any queries relating to information on this drawing are to be referred, in the first instance to the Lead Designer.
6. This drawing is to be read in conjunction with all information produced by the Lead Designer, Architect, Engineer and all other specialist trade contractors employed on this project.
7. It should not be assumed the steel frame shown on this drawing has been coordinated with other specialist trade contractors regarding construction interfaces. Any queries should be raised with the Lead Designer.
8. It is the responsibility of all specialist trade contractors that depend upon the steel frame for support to ensure they understand the tolerances defined in the current NSSS. Other specialist trade contractors must make provision in the design and construction of their works, including checking dimensions and positions on site if necessary, to deal with any potential conflict of tolerances which may arise.

Foundation Notes

Setting out and Tolerances

1. All grid lines and datum levels are to be established and maintained throughout the steel frame erection period by the Principal Contractor.
2. Only Caunton Engineering drawings should be used to set out holding down bolts and washer plates.
3. The setting out tolerances for all holding down bolts and cast foundation levels is to be in accordance with Section 9.1 of the NSSS.
4. If post drilled resin or mechanical anchors are shown on the drawings they are to be installed strictly in accordance with the manufacturers' instructions.

Construction Sequence

5. All holding down bolts, resin/mechanical anchors and washer plates shown on Caunton Engineering drawings are supplied and delivered to site by Caunton Engineering.
6. If post drilled resin or mechanical anchors are shown on the drawings and are to be installed before steel erection starts they will be delivered to site with the holding down bolts.
7. Marking out and drilling of concrete for resin or mechanical anchors is to be by others.
8. Holding down bolts are strength grade 8.8
9. Conical bolt tubes must be placed around each H.D. bolt to form a pocket that will allow full rotational movement of the bolt at the top of the pocket. These are not supplied by Caunton Engineering.
10. All holding down bolts, washer flats and tubes should be placed in the required position before concrete is poured.
11. All threads to be thoroughly greased and protected before concrete is poured.
12. All foundations must have a smooth and level surface onto which steel packing plates can be placed when steel erection starts.
13. Every holding down bolt must be able to move in the pocket so they should be checked and if necessary shaken after concrete is poured and before it hardens.
14. Pockets must be kept clear of debris to ensure holding down bolts can move.
15. All timber templates used to cast the foundations are to be removed by the Principal Contractor or groundworks contractor prior to steel erection starting.
16. If polystyrene bolt tubes are used they must be removed by the Principal Contractor or groundworks contractor prior to steel erection starting.

Damage to Holding Down Bolts

17. If any holding down bolt is damaged after installation the Principal Contractor must report the matter to Caunton Engineering.
18. If a grade 8.8 holding down bolt is bent after installation no attempt should be made to straighten it as this may lead to the bolt fracturing.

Grouting of Bases

19. The organisation responsible for designing foundations is also responsible for specifying the product to be used to grout the holding down bolts and underside of column bases.
20. After the structure has been lined, levelled & plumbed by Caunton Engineering, to the tolerances stated in Section 9.6 of the NSSS, it will be handed over to the Principal Contractor for final checking and grouting.
21. All columns must be grouted within 24 hours of being handed over. Caunton Engineering is not responsible for grouting of columns.

Design Responsibility

22. Caunton are not responsible for the design of the foundation. We have designed the base plate and holding down bolts assuming adequate depth to accommodate the specified bolt embedment and also assume that edge distance does not dictate. The foundation designer is to confirm that the foundation can accommodate the loads, including the design of any additional reinforcement that may be required.

General Notes

1. Do not scale from this drawing
2. Dimensions are in millimetres unless noted otherwise.
3. All levels are in metres unless noted otherwise
4. Erection mark for orientation denoted ▼
5. Only PDF issues of this drawing are controlled
6. All other formats of this drawing {e.g. DWG/AutoCad} are un-controlled and are used at your own risk.

Project Notes

1. Caunton Engineering is not the Principal or Lead Designer for this project.
2. The Lead Designer for this project has responsibility for approving this drawing.
3. The steel frame shown on this drawing has been designed to Eurocode 3.
4. The steel frame shown on this drawing will be erected in accordance with the tolerances specified in the current NSSS (National Structural Steelwork Specification)
5. Any queries relating to information on this drawing are to be referred, in the first instance to the Lead Designer.
6. This drawing is to be read in conjunction with all information produced by the Lead Designer, Architect, Engineer and all other specialist trade contractors employed on this project.
7. It should not be assumed the steel frame shown on this drawing has been coordinated with other specialist trade contractors regarding construction interfaces. Any queries should be raised with the Lead Designer.
8. It is the responsibility of all specialist trade contractors that depend upon the steel frame for support to ensure they understand the tolerances defined in the current NSSS. Other specialist trade contractors must make provision in the design and construction of their works, including checking dimensions and positions on site if necessary, to deal with any potential conflict of tolerances which may arise.

General Notes

1. Do not scale from this drawing
2. Dimensions are in millimetres unless noted otherwise.
3. All levels are in metres unless noted otherwise
4. Erection mark for orientation denoted
5. Only PDF issues of this drawing are controlled
6. All other formats of this drawing (e.g. DWG/AutoCad) are un-controlled and are used at your own risk.

Project Notes

1. Caunton Engineering is not the Principal or Lead Designer for this project.
2. The Lead Designer for this project has responsibility for approving this drawing.
3. The steel frame shown on this drawing has been designed to Eurocode 3.
4. The steel frame shown on this drawing will be erected in accordance with the tolerances specified in the current NSSS (National Structural Steelwork Specification)
5. Any queries relating to information on this drawing are to be referred, in the first instance to the Lead Designer.
6. This drawing is to be read in conjunction with all information produced by the Lead Designer, Architect, Engineer and all other specialist trade contractors employed on this project.
7. It should not be assumed the steel frame shown on this drawing has been coordinated with other specialist trade contractors regarding construction interfaces. Any queries should be raised with the Lead Designer.
8. It is the responsibility of all specialist trade contractors that depend upon the steel frame for support to ensure they understand the tolerances defined in the current NSSS. Other specialist trade contractors must make provision in the design and construction of their works, including checking dimensions and positions on site if necessary, to deal with any potential conflict of tolerances which may arise.

Specific Notes

Stair stringers to be FLT12*220
Landing steel to be PFC200*75*23 U.N.O
All pattern plate is 6mm on plain
All handrail posts are CHS42.4*3.2
All h'rail/k'rails are CHS42.4*3.2
Handrail is to be a "ball & stick" type system supplied in welded panels
Stairs, landings & h'rail to be galv
